

My vision of the AAGL:

For me, since I started my career and medical training, the AAGL has been an inspiring community.

Inspiration starts with the top-quality surgery, information, human and medical bonds associated with the institution, as well as being the “go to” place to understand where the future in technological and medical advances is taking us as a medical community.

It has been a place where innovation and learning meet the passion for learning, therefore providing the best care available on time for patients.

Taking part in this organization’s activities has allowed me to meet colleagues from around the world, learn from their experiences, and discover new ways to practice minimally invasive gynecology, leading me to new and updated versions for both worlds: younger physicians under our tutelage, and also for patient care.

Knowledge and teaching are an opportunity to give back what we learned to the world, further developing the scientific method, therefore, changing our medical community and attention quality.

As previously stated, understanding and comparing different medical system realities opens the door for professionals to innovate with effort and talent, making the contrast and unification of criteria the heart of an international scientific project.

AAGL expands its reach with accessible training programs, allowing whoever interested by reinforcing with adequate top-quality mentorship for young physicians, also creating networks that connect the institutions with centers of excellence in other parts of the world.

My vision in the near future, for any Latin American colleagues, is to have access to the same training and development opportunities that exist in other countries, adapting the most advanced technologies and techniques to our local conditions to provide better service to our patients.

Kindly.

Manuel Antonio López de la Torre
